Covalent bonding

Bobby was always a strange little nonmetal... he never liked to bond covalently. Sometimes, just to give it a try, he'd bond with another nonmetal...

And he'd be happy for a while, because he'd have filled his octet.

But no, he wasn't really one who wanted to SHARE all the time... And after a period, he'd stop.

Ionic bonding

Miss, you dropped an electron...

Oh, why thank you young man!

No, he was always more into ionic bonding...

Where they'd be attracted and bonded by charge and not through sharing... ooh ooh ooh!!! :D

And it was so that he met his life's love, Millie the Metalloid :D

metallic bonding

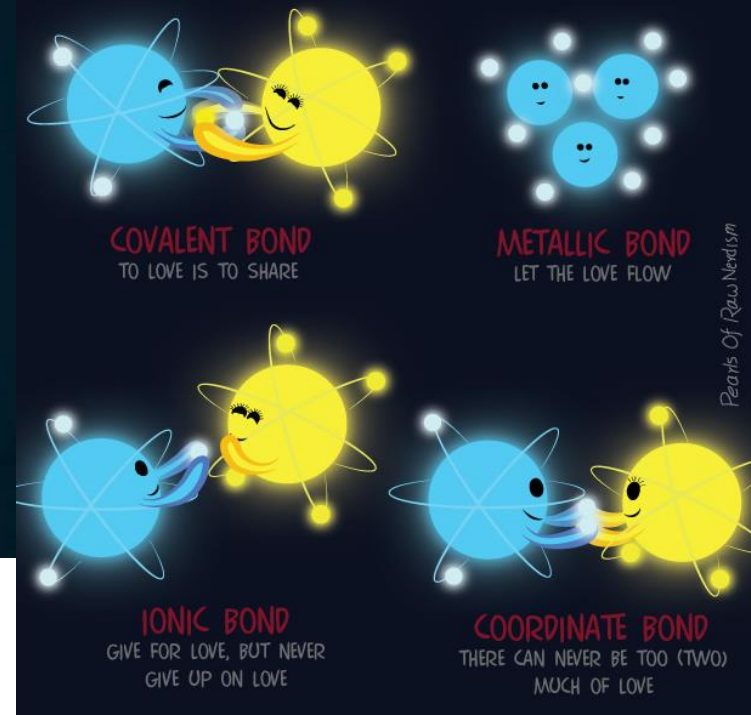

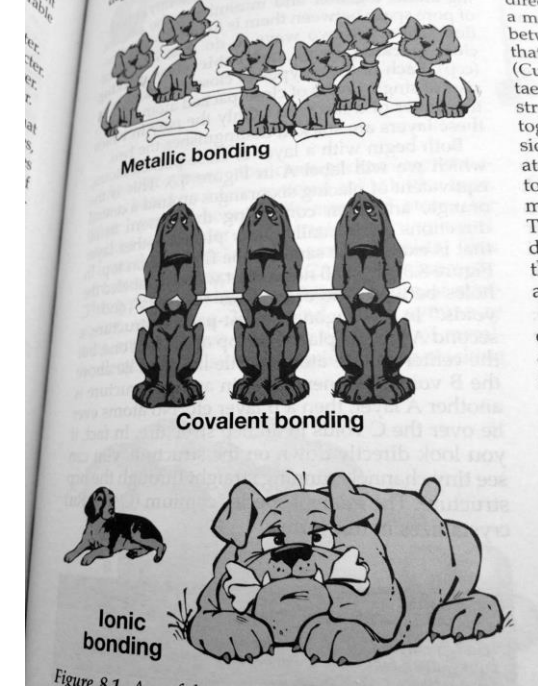

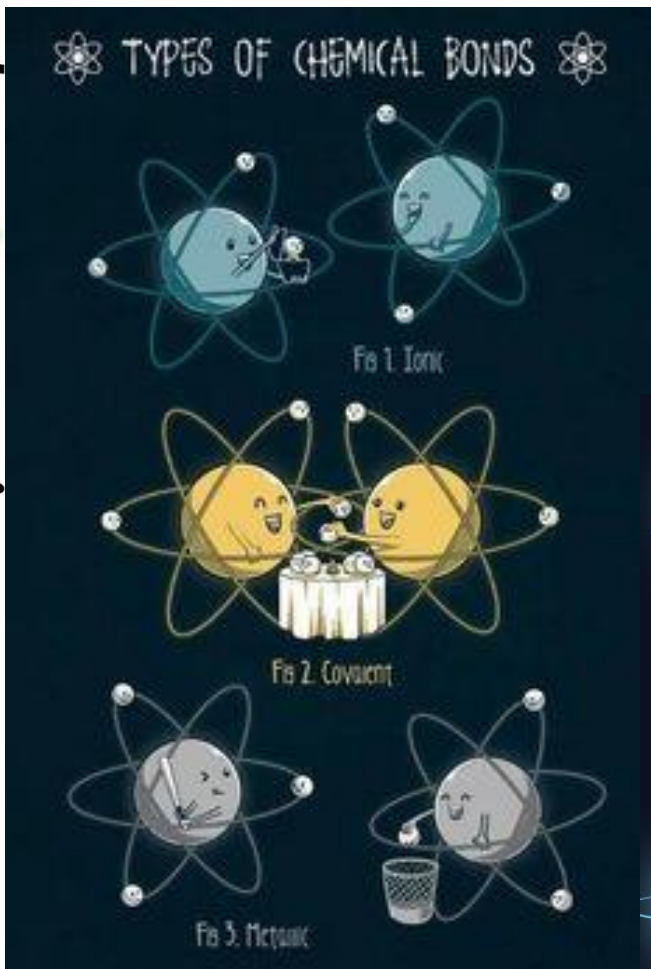

... In a school in FelTown this afternoon, a mass metallic bonding occurred between the schoolchildren when a PE teacher instructed them to use their electrons in a dodgeball game...

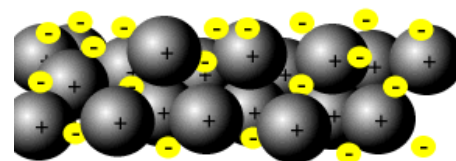

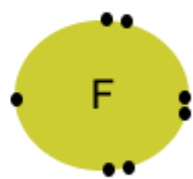

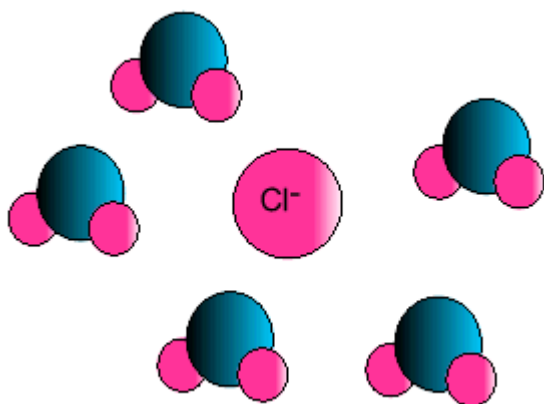

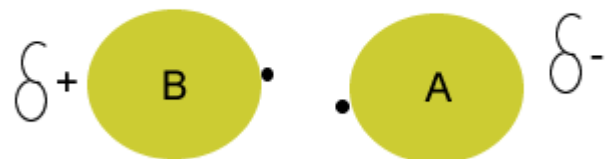

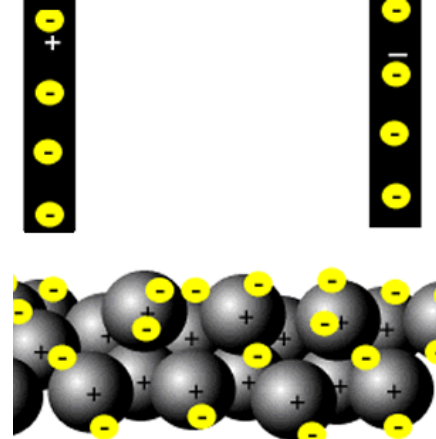

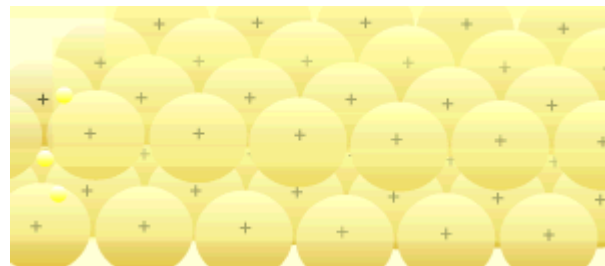

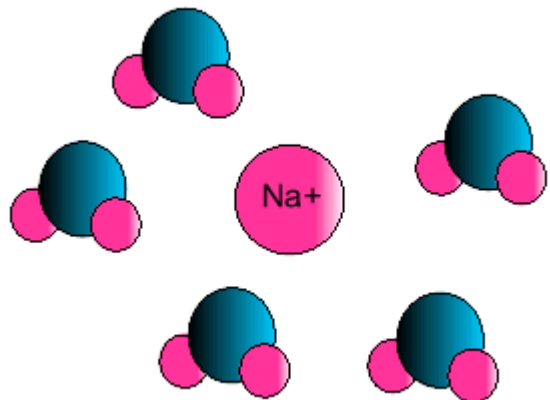

...the local police had to create hats of over 600 degrees to loosen the bonding...

Interrogations as to WHY the instructor neglected such basic knowledge in bonding continue.

And as for metallic bonding... well, he had no idea. It was only things that idiots did....

By Masako

Heat transferred by delocalised electrons
